Conclusion

# Motivation

An observation:

- ▶ Formal languages are mathematical objects that enjoy a diversity of representations.
- ▶ Representations are costly in formal, mechanized proofs.

Goal: a illustrative, self-contained formalization of results related to block pumping in Coq that includes:

- ▶ Closure properties of positively block pumpable languages under union, intersection and concatenation.

## Motivation

### Introduction

Formal languages

Pumping properties

The block pumping property

### A proof nugget

Informal proof

Formal proof

By the numbers

## Conclusion

# Formal languages: an overview

1. Definition: a set of **strings** over an **alphabet** with a **mechanism to decide membership**
  - ▶ alphabet  $\Sigma$ : a finite set of symbols  
e.g. [a-z], {0,1,2}
  - ▶ string/word: concatenation of symbols  
e.g. "meringue", 00101
  - ▶ mechanisms to decide membership:
    - ▶ via checking, i.e. abstract machines
    - ▶ via generating, i.e. derivation rules
2. Applications: compiler design, formal linguistics, text processing, model checking etc.

Motivation

Introduction

**Formal languages**

Pumping properties

The block pumping property

A proof nugget

Informal proof

Formal proof

Picture view

By the numbers

Conclusion

A language is regular iff there exists a **finite automaton** that accepts all words in the language, and rejects all words not in the language.

# An example

Let  $\Sigma = \{0, 1\}$  and

$L = \{w : w \text{ is of odd length and ends in } 1\}$ .

$w_1 = 10$

$w_2 = 00101$

Conclusion

Ehrenfeucht, Parikh and Rozenberg (1981)

## The block pumping property

$L \subseteq \Sigma^*$  has the block pumping property iff there exists a  $k$  such that for all  $w \in \Sigma^*$  and all ways of inserting  $k$  breakpoints into the word, there exist two breakpoints such that the word part in between them can be *repeated* or *omitted* without affecting word membership.

# Mr. Pumping Lemma

Given a language  $L \subseteq \Sigma^*$ ,

1. You pick a pumping constant  $k$ .
2. Mr. Pumping Lemma picks a word  $w$ , and a set of breakpoints  $bps$  of size  $k$ .
3. You pick two breakpoints  $bp_1$ ,  $bp_2$  from the breakpoint set  $bps$ .
4. Mr. Pumping Lemma pumps the word part between  $bp_1$  and  $bp_2$  any number of times.

If the membership of the resulting word  $w'$  remains the same as the membership of the original word  $w$  in  $L$ , then you win. Otherwise, Mr. Pumping Lemma wins.

Conclusion

Theorem of Ehrenfeucht, Parikh and Rozenberg

Regularity, the block pumping property, and the block cancellation property are equivalent.

# EPR's Theorem

# EPR's proof, in pictures

## Lemma 2

There are finitely many languages that BC(k).

## Lemma 3

If BC(k, L), then for all  $x$ , BC(k,  $L_x$ ).

## Lemma 4

For any property P, if  
(i) there are finitely many languages that P,  
(ii) if L satisfies P so do all its derivatives,  
then P implies regularity.

## Lemma 1

BC  $\rightarrow$  regularity

## Lemma 2

There are finitely many languages that BC(k).

# EPR's proof, in pictures

## Lemma 2

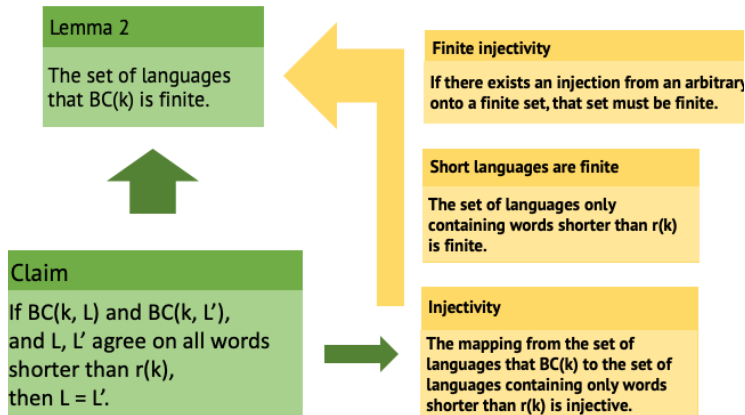

There are finitely many languages that BC(k).

## Claim

If  $BC(k, L)$  and  $BC(k, L')$ ,  
and  $L, L'$  agree on all words  
shorter than  $r(k)$ ,  
then  $L = L'$ .

# Finite injectivity, in Coq

## Theorem (Finite injectivity)

```
inj_finite
: forall (P Q : X -> Prop)
  (f : {x : X | P x} -> {x : X | Q x}),
  inhabited {x : X | P x} ->
  injective P Q f ->
  is_finite_dep Q ->
  is_finite_dep P.
```

where:

- ▶  $X$  - language
- ▶  $P$  - property of being block cancellable with  $k$
- ▶  $Q$  - property of only containing words shorter than  $r(k)$
- ▶  $f$  - mapping from  $BC(k)$  languages to short languages

Conclusion

# Finiteness, in Coq

## Definition (Dependent finite)

```
is_finite_dep {X : Type}
              (P : X -> Prop) : Prop :=
  exists (L : list {x | P x}),
  forall (x : {x | P x}), In x L.
```

## Definition (Finite)

```
is_finite {X : Type}
          (P : X -> Prop) :=
  exists (L : list X), forall (x : X),
  In x L <-> P x.
```

One question: how to characterize the expressive power of dependent types in Coq's type theory?

One takeaway: automata theory through the lens of functional manipulation of inductive data types

# Formal definitions : Injective

[Motivation](#)[Introduction](#)[Formal languages](#)[Pumping properties](#)[The block pumping property](#)[A proof nugget](#)[Informal proof](#)[Formal proof](#)[Picture view](#)[By the numbers](#)[Conclusion](#)

## Definition (Injective)

```
injective {X Y : Type}
  (P : X -> Prop) (Q : Y -> Prop)
  (f : {x | P x} -> {y | Q y}) :=
forall (x1 x2 : {x | P x}),
f x1 = f x2 -> x1 = x2.
```

# Two views of propositional information

*"All numbers greater than 2 are greater than 1."*

On the set-theoretic view:

1. For all  $n \in \mathbb{N}$ , if  $n > 2$  then  $n > 1$ .
2. For all  $n \in \{n : n > 2\}$ ,  $n > 1$ .

On the type-theoretic view:

1.  $\forall n : \mathbf{nat}, n > 2 \rightarrow n > 1$ .
2.  $\forall n : \{n : \mathbf{nat} \mid n > 2\}, n > 1$ .

# Dependent types in Coq

Dependent types are types that **carry propositional information**.

## Definition (Dependent types)

```
Inductive sig (A : Type)
  (P : A -> Prop) : Type :=
  exist : forall x : A, P x -> {x : A | P x}.
```

[Motivation](#)[Introduction](#)[Formal languages](#)[Pumping properties](#)[The block pumping property](#)[A proof nugget](#)[Informal proof](#)[Formal proof](#)[Picture view](#)[By the numbers](#)[Conclusion](#)

# Ramsey's Theorem

Motivation

Introduction

Formal languages

Pumping properties

The block pumping property

A proof nugget

Informal proof

Formal proof

Picture view

By the numbers

Conclusion

For all  $k \in \mathbb{N}$  and finite set  $Q$  of colors, there exists an  $r(k) \in \mathbb{N}$  such that for every ordered set  $I$  of size  $r(k)$  and every coloring function  $C$  mapping ordered pairs  $i, j \in I$  to a color  $C(i, j) \in Q$ , there exists a monochromatic subset of  $I$  of size  $k$ .

# EPR's Proof

To prove:

## Lemma 2

There are only finitely many languages block cancellable with  $k$ .

it is sufficient to show that:

## Claim

If  $L, L'$  are block cancellable with  $k$  and for all strings  $x$  with  $|x| < r(k)$ ,  $x \in L$  iff  $x \in L'$ , then  $L = L'$ .
